

BEFORE THE
STATE OF NEW YORK
PUBLIC SERVICE COMMISSION

In the Matter of

National Fuel Gas Distribution, Inc.

Case 07-G-0141

June 2007

Prepared Testimony of:

SAFETY PANEL

Terry Wasielewski
Utility Engineer 2 (Safety)

Richard Lepkowski
Utility Analyst 2 (Safety)

Office of Gas & Water
State of New York
Department of Public Service
Three Empire State Plaza
Albany, New York 12223-1350

1 Q. Please state your names and business address.

2 A. Terry Wasielewski and Richard Lepkowski, Three
3 Empire State Plaza; Albany, New York, 12223-
4 1350.

5 Q. Mr. Wasielewski, by whom are you employed and in
6 what capacity?

7 A. By the New York State Department of Public
8 Service as a Utility Engineer 2 (Safety)
9 assigned to the Office of Gas and Water. My
10 educational experience includes a Bachelor of
11 Science degree in Electrical Engineering from
12 Rochester Institute of Technology (1985), a
13 Masters of Business Administration from American
14 International College (1989) and a Professional
15 Engineers License in the State of Connecticut. I
16 am responsible for organizing, scheduling,
17 coordinating and directing the field activities
18 of the Buffalo area office. The field activity
19 program includes comprehensive safety and
20 reliability evaluations of upstate utilities and
21 covers all aspects of operations, maintenance
22 and construction of jurisdictional natural gas

1 pipelines. I am familiar with all New York
2 State and federal gas and liquid pipeline safety
3 codes, including the overall operations of the
4 major upstate gas utilities.

5 Q. Have you previously testified in a regulatory
6 proceeding?

7 A. No.

8 Q. Mr. Lepkowski, what is your position with the
9 Department of Public Service?

10 A. I am a Utility Analyst 2 assigned to the Office
11 of Gas and Water, Safety Section in the Buffalo
12 Office.

13 Q. Mr. Lepkowski, please state your education and
14 experience.

15 A. I graduated in June 1981, from the State
16 University of New York at Buffalo, with a
17 Bachelor of Science degree in Industrial
18 Technology. I have been employed by the
19 Department of Public Service since November
20 1985. I am responsible for the investigation
21 and analysis of gas pipeline facilities, company
22 standard practices and records related to system

1 design, construction, operation and maintenance.
2 My duties also include assuring compliance with
3 the federal and state pipeline safety
4 regulations that apply to gas utilities and
5 pipeline operators. Investigation of complaints
6 from utility customers and the public regarding
7 pipeline safety, service issues, and
8 facilitation of the resolution between the
9 utilities and complainants are also part of my
10 responsibilities. I am also required to prepare
11 detailed reports related to my investigations,
12 analyses, audit findings and recommendations.
13 I am familiar with federal and state gas safety
14 pipeline codes and with the operations of both
15 major and small gas utilities in New York State.

16 Q. Have you previously testified in a regulatory
17 proceeding?

18 A. Yes, I have previously testified in rate cases
19 involving Corning Natural Gas (Case 02-G-0003),
20 NYSEG (Case 01-G-1668) and NFG (Case 04-G-1047).

21 Q. What is the purpose of the Safety panel's
22 testimony?

- 1 A. The purpose of our testimony is to recommend
2 safety performance targets, which will become
3 incentives for National Fuel Gas Distribution
4 Corporation (Distribution or the Company) to
5 maintain and improve specific areas regarding
6 the safety of its gas distribution system.
7 These incentives should focus the company's
8 attention on areas widely accepted as of high
9 importance, and help ensure service reliability.
10 The targets are derived from the company's
11 actual levels of historic performance, our
12 knowledge of Distribution, and our experience
13 with other local distribution companies across
14 the state.
- 15 Q. What does the Safety Panel recommend in the area
16 of safety performance incentives?
- 17 A. We recommend, at a minimum, that Distribution be
18 required to implement the safety performance
19 incentives listed below for the Calendar Year
20 2008, and for each subsequent year until the
21 rate plan resulting from this proceeding is
22 superseded. The safety performance incentives

1 are assigned a total of 30 basis point
2 equivalent of regulatory liability.

3 Q. Is the Panel sponsoring any exhibits?

4 A. No.

5 Q. Did Distribution propose any safety related
6 targets in its filing?

7 A. No. However, the company's current rate plan
8 provides that its existing safety related
9 targets will continue until changed by the
10 Commission. While we agree with some of the
11 existing targets, we have concluded that most
12 are inadequate based on the company's actual
13 performance, and the level of safety it can
14 provide the public.

15 Q. Please list the panel's proposed Safety
16 Performance Incentives.

17 A. The panel recommends that Distribution be
18 required to implement the following four safety
19 performance incentives:

20 (1) Infrastructure Enhancement

21 (2) Leak Management

22 (3) Emergency Response to Gas Leak/Odor Calls

1 (4) Prevention of Excavator Damages

2 Q. Please provide an overview of the Panel's
3 recommendations.

4 A. Each safety incentive is discussed below:

5 (1) Infrastructure Enhancement

6 (a.) Leak Prone Steel/Cast Iron and plastic
7 Main Removal

8 We recommend setting an annual goal to eliminate
9 80 miles of leak-prone pipe.

10 Q. What is the basis for this infrastructure
11 enhancement incentive?

12 A. We are recommending an infrastructure
13 enhancement incentive intended to ensure that
14 Distribution proactively addresses its leak
15 prone pipe. Historical leak totals and main
16 inventory mileages have shown that Distribution
17 should continue targeting bare steel, cast iron
18 and any other leak prone pipe, such as early
19 vintage plastic, for replacement.

20 Q. Why are you recommending 80 miles of main?

21 A. Our review has shown that Distribution is
22 capable of maintaining current levels of

1 targeted pipe replacements within its existing
2 capital budget.

3 According to its annual inventory reports filed
4 with the United States Department of
5 Transportation (USDOT), Form RSA F 7100 1-1,
6 Distribution removed a combined total of 86
7 miles of bare steel and cast iron mains in
8 2005. In 2006, Distribution replaced a combined
9 total of 71 miles of bare steel and cast iron
10 mains. The average bare steel cast iron removal
11 mileage for this period is 78.50 miles.

12 Q Please describe the leak-prone pipe replacement
13 component of the safety performance incentive.

14 A. The initial premise of our recommendation is
15 that Distribution continues to replace leak-
16 prone pipe at a rate not less than their
17 historical capability.

18 Q. Please explain what you mean by "leak-prone"
19 pipe.

20 A. Leak-prone pipe is generally considered steel
21 pipe that is unprotected, cast iron pipe, and
22 some vintages of plastic pipe that can become

1 brittle.

2 Q. What is meant by "unprotected?"

3 A. It means the pipe lacks cathodic protection, a
4 method by which steel pipelines are protected
5 from corrosion. Such unprotected pipe is also
6 referred to as "bare" steel. For our purposes
7 here, bare steel pipe also includes pipe that is
8 ineffectively coated.

9 Q. How does the bare steel component of the
10 recommended safety incentive add to the safety
11 of the gas system?

12 A. Corrosion is a leading cause of leakage and bare
13 steel pipe is the most susceptible to corrosion.

14 Q. How does the removal of cast iron pipe add to
15 the safety of the gas system?

16 A. Due to its physical characteristics, cast iron
17 pipe is more prone to catastrophic failures than
18 cathodically protected steel pipe and plastic
19 pipe. Small diameter cast iron pipe, defined as
20 eight inches or less in nominal diameter, is
21 even more prone to structural failure, due to
22 brittleness and low beam strength. Removal of

1 this pipe will reduce the potential for leaks
2 and incidents resulting from failures. Cast
3 iron pipe tends to be located in older, more
4 densely populated areas with many enclosed
5 structures and paved areas. These circumstances
6 tend to be more conducive to the below-ground
7 migration of gas across wider areas than would
8 occur in rural areas. The more congested the
9 environment the greater the risk of fires or
10 explosions. The removal of these leak-prone
11 facilities will also benefit the company and
12 improve public safety by reducing leak backlogs.

13 Q. What criteria should be used for the removal of
14 leak-prone pipe?

15 A. We recommend that Distribution continue to use
16 its leak-prone pipe replacement candidate
17 selection process known as the Pipeline
18 Replacement Expenditure Program (PREP). The
19 PREP process incorporates a computer program to
20 evaluate leak-prone piping segments based on
21 criteria including type of material such as bare
22 steel or cast iron, certain vintages of plastic

1 pipe, leakage history, active corrosion and
2 location of pipe in relation to structures and
3 pavement where gas could migrate and gather if
4 leakage occurs. The PREP program ranks risk,
5 reliability, and economic factors and
6 prioritizes these segments for replacement. The
7 assigned risk priority level guides the company
8 to remove its highest-risk pipe first and
9 thereby improve the overall safety of the system
10 through lower leak rates.

11 (b) Bare Steel Service Replacement

12 Q. Please describe the bare steel service component
13 of the infrastructure replacement performance
14 incentive.

15 A. We recommend Distribution remove a minimum of
16 4,000 bare steel services for calendar year
17 2008.

18 Q. How does this incentive add to public safety?

19 A. Service lines are part of the gas system that
20 interconnects the gas distribution main to the
21 customer's building or premises and therefore,
22 are in the closest proximity to the customer's

1 structure. Should a leak occur in a service
2 line, there is a greater potential for gas to
3 migrate into the structure than there is from a
4 leaking gas main, since services are generally
5 closer to a customer's building. Gas migration
6 into a structure could cause a catastrophic
7 event, such as a fire or explosion. Unprotected
8 steel services are prone to deteriorate by
9 corrosion at a faster rate than cathodically
10 protected steel services or those made of other
11 materials.

12 Q. What was the actual level of bare steel service
13 removals over the previous years?

14 A. According to its annual inventory reports filed
15 with the United States Department of
16 Transportation (USDOT), Form RSA F 7100 1-1,
17 Distribution's bare steel service inventories at
18 the end of 2005 and 2006 identify the removal of
19 4492 and 4790 bare steel services, respectively.
20 However, in 2005, the company included a total
21 of 732 bare steel service removals that were
22 actually record corrections, and not actual

1 removals performed that year. The actual 2005
2 bare steel physical removal total is 3760.
3 Therefore, the company has averaged a removal
4 rate of 4,275 bare steel services over the
5 period.

6 Q. What is the impact of this recommendation in the
7 current rate case?

8 A. For this incentive, we recommend the company
9 maintain historic capability and capital
10 expenditure levels required to continue to
11 reduce its inventory of this leak-prone service
12 piping.

13 Q. Do you recommend any criteria that should be
14 used for selecting bare steel service removal
15 candidates?

16 A. The company should first focus on removal of
17 bare steel services associated with distribution
18 main candidates selected as part of the PREP
19 program.

20 Q. What if the company cannot meet the target of
21 4000 bare steel services using this method
22 alone?

1 A. The company should identify and rank bare steel
2 service replacement candidates by risk,
3 reliability and economic factors, and then
4 remove them in the most cost effective way to
5 achieve the target.

6 (2) Leak Management

7 Q. What do you recommend for leak management?

8 A. For this incentive, we recommend the company
9 maintain a calendar year-end backlog of
10 hazardous leaks less than or equal to 75 leaks.
11 A hazardous leak poses a hazard to the public
12 and must be repaired within a specified time
13 period under New York pipeline safety
14 regulations.

15 Q. Please discuss the purpose of the leak repair
16 management performance incentive.

17 A. The overall objective of the leak management
18 performance incentive is to gauge the company's
19 performance in managing the number of hazardous
20 leaks on its system. Minimizing the number of
21 leaks helps reduce the potential for incidents
22 involving natural gas. A lower year-end

1 inventory of hazardous leaks will gauge the
2 company's year-round repair effort and minimize
3 the hazards to the public during frost
4 conditions, when there is a higher risk of gas
5 migration into homes because the gas cannot vent
6 to atmosphere as readily. Therefore, this
7 incentive is expected to cause the company to
8 reduce the number of leaks and thereby provide a
9 higher level of safety to the public.

10 Q. How did you determine the number of the year-end
11 leak backlog?

12 A. We reviewed company data for calendar years 2005
13 and 2006. The annual year-end hazardous leak
14 backlogs were reported as 110 and 77, for this
15 period, respectively. We believe that our
16 proposed 2008 goal of 75 hazardous leaks is
17 within the company's reach since the company has
18 already nearly achieved that performance level.

19 (3) Emergency Response to Gas Leak/Odor Calls

20 Q. What do you recommend for response to leak and
21 odor calls?

1 A. Consistent with statewide standards for
2 Emergency Response, we recommend the following
3 performance incentives for Distribution:

4 a) Respond to 75% of all gas leak and odor
5 calls within 30 minutes

6 b) Respond to 90% of all gas leak and odor
7 calls within 45 minutes.

8 c) Respond to 95% of all gas leak and odor
9 calls within 60 minutes

10 Q. Please describe the Emergency Response
11 performance incentive?

12 A. This incentive evaluates the company's response
13 to gas leak, odor and emergency calls generated
14 by the public and non-company personnel. Each
15 company is required by gas safety regulations to
16 provide a monthly report of the total number of
17 calls received and responded to in intervals of
18 15 minutes during normal business hours,
19 weekdays outside of business hours, and weekends
20 and holidays. This incentive, in addition to
21 the leak management and damage prevention
22 incentives, is included in the Safety Section's

1 annual performance report to the Commission
2 (Case 06-G-0566, Gas Safety Performance Measures
3 Report, issued June 1, 2006). Our proposal is
4 consistent with the existing statewide standard
5 jointly established by Staff and the utilities.

6 Q. What has been Distribution's performance in this
7 measure in recent years?

8 A. For the 30-minute response goal, Distribution
9 responded to 88.5% and 91.1% for 2005 and 2006,
10 respectively. For the 45 minute response goal,
11 NFGD responded to 96.8% and 97.0% for 2005 and
12 2006, respectively. For the 60-minute response
13 goal, NFGD responded to 99.0% in both 2005 and
14 2006. Since the company is currently exceeding
15 the targets, our recommendation of the accepted
16 statewide targets simply encourages it to avoid
17 significant deterioration in performance.

18 Q. How will the emergency response incentives
19 increase public safety?

20 A. Leaks on inside piping, improperly operated or
21 installed appliances, and gas migration into a
22 building from leaks on outside buried piping

1 present a risk to the general public. The
2 company recognizes this and dispatches crews in
3 response to calls reporting gas leaks or odors
4 on a priority basis. The potential for an
5 incident and physical harm to the general public
6 increases as the company's response time
7 lengthens. Therefore, it is important to
8 minimize the response times to calls of gas odor
9 and/or gas leaks.

10 (4) Prevention of Excavation Damage

11 Q. What do you recommend for the prevention of
12 excavation damages?

13 A. We recommend the following excavation damage
14 prevention safety incentives for calendar year
15 2008:

16 a) Achieve an annual level of less than or
17 equal to 0.90 damages per 1,000 One-Call
18 Tickets for Mis-mark damages.

19 b) Achieve an annual level of less than or
20 equal to 0.20 damages per 1,000 One-Call
21 Tickets for damages due to excavation by

1 company personnel and outside
2 contractors in the company's employment.
3 c) Achieve an annual level of less than or
4 equal to 4.20 total damages per 1,000
5 One-Call Tickets.

6 Q. What is a "One-Call Ticket?"

7 A. The Public Service Commission's regulations
8 contained in 16 NYCRR Part 753 - Protection of
9 Underground Facilities - require excavators to
10 make a toll-free call to a "one-call"
11 notification system and provide notice of their
12 intent to perform excavation work. The one-call
13 notification system that covers Distribution's
14 territory is Dig Safely New York, which takes
15 the pertinent information from the excavator and
16 transmits it to its member utilities that may be
17 affected by the excavation work. Those
18 utilities then mark the location of their
19 affected facilities so the excavator can avoid
20 damaging them. Each incoming call to Dig Safely
21 New York will generate several outgoing notices
22 to the member utilities such as the gas,

1 electric, telephone, cable, and water companies.

2 A notice received by the utility is referred to
3 as a One-Call ticket.

4 Q. Please define the term "Mis-mark."

5 A. The term "Mis-mark" is used to describe
6 instances where buried facilities in the work
7 area are not accurately marked. For purposes of
8 this measure, an accurate mark shall be
9 considered as within the tolerance zone as
10 described in Part 753. The "tolerance zone" is
11 defined as the diameter of the underground
12 facility plus two feet on either side of the
13 designated centerline when the diameter is
14 known, or two feet on either side of the
15 designated centerline if the diameter of the
16 underground facility is not known.

17 Q. Please describe the performance incentives
18 regarding the prevention of excavation damage
19 caused by Mis-marks?

20 A. As an operator of a natural gas distribution
21 system, Distribution participates in the local
22 one-call/damage prevention system in an effort

1 to minimize the instances of damage inflicted on
2 their pipes by excavation activities. In order
3 to comply with 16 NYCRR Part 753, Distribution
4 must respond to all requests for a mark out by
5 excavators, physically locate their pipes, and
6 mark out the locations on the ground. This
7 performance incentive will gauge how well these
8 mark outs are conducted.

9 Q. Please describe damages by company and company
10 contractors.

11 A. Distribution, by the nature of its work, employs
12 both contract excavators and conducts its own
13 excavations. In these cases, 16 NYCRR Part 753
14 does not require the company to mark out its own
15 underground facilities, because there are maps
16 and field sketches readily available to the
17 company employees and contract excavators that
18 identify the location of the company facilities.

19 Q. Are damages due to excavation a big concern in
20 Distribution's service territory?

21 A. Yes. According to both New York State and
22 National statistics, the leading cause of

1 pipeline failures and incidents is damage by
2 excavation activities. Marking of facilities
3 and company-sponsored excavations are two areas
4 where Distribution has the greatest control.
5 Therefore, the company should concentrate its
6 efforts in these areas where it can have the
7 most direct impact, and not rely on influencing
8 the actions of others.

9 Q. How did the panel derive the targets for the
10 damage incentives?

11 A. We examined Distribution's actual performance
12 for 2005 and 2006, and chose a reasonable
13 performance level based on the company and
14 statewide data. For incorrect marking of
15 company facilities, Distribution experienced
16 1.51 and 1.09 damages per 1000 One-Call Tickets
17 in 2005 and 2006, respectively. Our proposed
18 target of 0.90 for 2008 is the most recent
19 statewide performance level for this incentive.
20 We used the same methodology for the damages due
21 to excavation by company personnel and outside
22 contractors, and total damages. The company

1 experienced 0.24 and 0.14 damages due to
2 excavation by company personnel or outside
3 contractors in 2005 and 2006, respectively. For
4 total damages the numbers were 6.42 and 4.98
5 respectively. The Panel's targets of 0.20 for
6 company excavator damages and 4.20 for total
7 damages are based on historic statewide
8 performance levels. These incentives will
9 encourage Distribution to target a level of
10 public safety better than it has historically
11 experienced.

12 Q. Please discuss overall damages.

13 A. Damages caused by excavator failure to notify
14 Dig Safely New York and/or unsafe excavation
15 practices are not totally within the control of
16 the company. However, the company can minimize
17 these damages by influencing excavator activity
18 through education and outreach efforts to
19 excavators, by continuing to bill excavators for
20 repair costs when the excavator is at fault, and
21 by referring problem contractors to Department
22 Staff for possible enforcement activities.

1 Q. Are "No-Call" damages a factor in the Total
2 Damages Measure?

3 A. Yes. No call damages are simply instances where
4 no ticket was generated because the excavator
5 did not provide notice of intent to excavate.
6 This metric is part of the Total Damages and
7 provides an indication of the general level of
8 awareness excavators have about the one-call
9 notification system. Recent legislation by the
10 Federal Communications Commission mandated the
11 creation of a single nationwide "three-digit"
12 telephone number "811" that excavators can call
13 to request the markout of any underground
14 facility. The single telephone number "811"
15 will relieve excavators from having to remember
16 multiple phone numbers if they work in areas
17 covered by different one-call centers across the
18 country. The number officially became effective
19 in April 2007, and Dig Safety New York is
20 participating.

21 Q. Do the recommended targets for overall damages
22 per 1,000 One-Call tickets already include the

1 company Mis-mark and company contractor

2 components?

3 A. Yes.

4 Q. Why are you recommending a separate total damage

5 target?

6 A. Even if it appears that the targets for Mis-mark

7 and/or company and company contractor damages

8 will be exceeded, the companies will have an

9 incentive to keep these figures as low as

10 possible because they would still be

11 contributing to the overall damages incentive.

12 Q. Please explain the basis for your proposed

13 regulatory liability revenue adjustments for

14 each of the measures described previously.

15 A. We revisited Distribution's current gas safety

16 operations non-compliance regulatory liability

17 adjustment levels and determined the proposed

18 basis point level is consistent with other

19 current rate cases to maintain an adequate focus

20 on gas safety and reliability.

1 Q. Do you have specific recommended rate
2 adjustments that will be assigned for failure to
3 meet the proposed safety performance measures?

4 A. Yes. We recommend the following regulatory
5 adjustments be assessed in the corresponding
6 rate year ending December 31, 2008. We derived
7 the approximate value of a single basis point at
8 \$64,000. The distribution of the adjustments is
9 relative to the amount of work or effort
10 required by the company to meet the targets.

11 (1) Infrastructure Enhancement - (eight basis
12 points) Failure to comply with either (a) or
13 (b) will result in a regulatory liability of
14 four basis points each or approximately
15 \$256,000.

16 (a) Failure to achieve the annual removal goal
17 of 80 miles of leak-prone bare steel, cast
18 iron and plastic mains will result in a
19 regulatory liability of four basis points or
20 approximately \$256,000.

21 (b) Failure to remove a minimum of 4,000

1 bare steel services will result in a
2 regulatory liability of four basis points
3 or approximately \$256,000.

4 (2) Leak Management - (eight basis points)

5 Failure to achieve a year-end backlog
6 inventory of hazardous leaks will result
7 in a regulatory liability of eight basis
8 points or approximately \$512,000.

9 (3) Emergency Response to Gas Leak/Odor Calls

10 (a) Respond to 75% of all gas leak and odor
11 calls within 30 minutes.

12 (b) Respond to 90% of all gas leak and odor
13 calls within 45 minutes.

14 (c) Respond to 95% of all gas leak and odor
15 calls within 60 minutes.

16 Failure to comply with (a) will result in a
17 regulatory liability of one basis point, or
18 approximately \$64,000.

19 Failure to comply with (b) will result in a
20 regulatory liability one basis point, or
21 approximately \$64,000.

22 Failure to comply with (c) will result in a

1 regulatory liability of one basis point, or
2 approximately \$64,000.

3 (4) Excavator Damage Prevention - (eleven basis
4 points) Failure to comply with either (a), (b)
5 or (c) will result in a regulatory liability
6 as follows:

- 7 a) Maintain an annual level of less than or
8 equal to 0.90 damages per 1,000 One-Call
9 Tickets for Mis-mark damages caused by
10 incorrect marking of company facilities.
11 Failure to achieve this level will result
12 in a regulatory liability of four basis
13 points or approximately \$256,000.
- 14 b) Maintain an annual level of less than or
15 equal to 0.20 damages per 1,000 One-Call
16 Tickets for damages due to excavation by
17 company personnel or outside contractors in
18 the company's employment.
19 Failure to achieve this level will result
20 in a regulatory liability of three basis
21 points or approximately \$192,000.

1 c) Maintain an annual level of less than or
2 equal to 4.20 total damages per 1,000 One-
3 Call Tickets.

4 Failure to achieve this level will result
5 in a regulatory liability of four basis
6 points or approximately \$256,000.

7 Q. Are there any additional recommendations
8 regarding the aforementioned performance
9 incentives?

10 A. Yes. The Safety Panel recommends that
11 Distribution be required to implement the
12 aforementioned safety recommendations and
13 performance incentives for calendar year 2008
14 and remain at the 2008 target levels for each
15 subsequent year until the mechanisms recommended
16 in this proceeding are superseded in the future
17 by the Commission.

18 Q. Are there any other conditions that the
19 companies should meet pertaining to your safety-
20 related recommendations?

21 A. Yes, we urge the Commission to direct
22 Distribution to submit a report to the Director

1 of the Office of Gas and Water on its
2 performance in the areas of the recommended
3 targets in this testimony within 30 days
4 following the end of the calendar year. In
5 addition, all targets and the application of
6 revenue adjustments for targets that are not
7 achieved should continue on a year-to-year basis
8 until changed by the Commission.

9 Q. Does this conclude your panel testimony at this
10 time?

11 A. Yes.
